

KÜHLKETTE & LOGISTIK / REGION BASEL

BioValley – Logistics Intelligence

Edon Kurtaj, Elton Malici, Gentian Sadriu

TRANSPORT CONTEXT

KÜHLKETTE & LOGISTIK

Why this challenge

01 Had the most fun discussing possible ideas or solutions

02 Longer journeys and exposed handoffs can increase cold-chain risk.

03 Production deadlines make transport delays matter.

04 We chose a Basel challenge with local weather, road and river signals we could bring together.

What we built

01 An API collector fetches public observations and stores them in a database.

02 A Basel map dashboard shows recent temperature, traffic alerts, wind and Rhine levels.

03 Scenario index weights: thermal exposure 50% · production urgency 30% · route disturbance 20%.

04 Live regional conditions stay separate from simulated package and route scenarios.

Demo: live context, simulated shipment

01 Live mode: regional observations with timestamps and freshness.

02 Demo mode: synthetic shipments with buffer, expedite and reroute suggestions.

03 Extreme case: simulated package excursion, 45-minute route delay, 20 minutes of production slack.

KÜHLKETTE & LOGISTIK

Future improvements

01 Validate the rules with logistics and quality specialists for each material and package.

02 Add qualified package-temperature sensors and GPS for real-time shipment evidence.

03 Evaluate truck-suitable navigation and restrictions. Mapbox is one option to assess.

04 Until then: planning prototype only.

Our experiences at HackAmRhein

01 First Hackathon, small but good introduction for future events

02 Well organized

03 First time using Agents, Workspace and AI in such a manner

04 Key takeaway: Try to have fun, make experiences and create something you can be proud of.
